

Router

We created Router, a web application for creating food journey for traveling, with the MEAN stack as the technology frame. The user has the option to search for restaurants, backed by Yelp Fusion API, with pictures of their food from Google Custom Search API. Inputs from the user include locations and cuisine (e.g. local food, grill, Chinese, etc). Restaurants visited by the user will be stored in a database. The front end will be written using Angular 5, with backend in NodeJS/ Express, and database in MongoDB. A cache using MongoDB to store recent search queries. If a user does not have a Twitter account, they can also sign up using their email.
